

70-691

TS: Windows HPC Server 2008, Developing

Document version: 19.10.11

Important Note About 70-691 PDF

techeXams' **70-691 PDF** is a comprehensive compilation of questions and answers that have been developed by our team of certified professionals. In order to prepare for the actual exam, all you need is to study the content of this exam questions. An average of approximately 10 to 15 hours should be spent to study these exam questions and you will surely pass your exam. It's our guarantee.

Question: 1.

You plan to develop a parallel application by using Windows HPC Server 2008. You plan to use a method to control the calculations performed by each individual process. You need to ensure that different commands can be sent to each process. Which function should you use?

- A. MPI_Send
- B. MPI_Bcast
- C. MPI_Gather
- D. MPI_Reduce

Answer: A

Question: 2.

You plan to develop a parallel application by using Windows HPC Server 2008. You need to implement a method that will send different data to each process in a communicator by using a single call. Which function should you use?

- A. MPI_Send
- B. MPI_Gather
- C. MPI_Reduce
- D. MPI_Scatter

Answer: D

Question: 3.

You plan to develop a parallel application by using Windows HPC Server 2008. The application performs the following tasks: ·Performs multistep calculations ·Processes data by using the same code segment that runs on each compute node You need to ensure that each compute process executes the same step simultaneously. Which type of communication should you use?

- A. Buffered
- B. Collective
- C. Non-blocking

D. Point-to-point

Answer: B

Question: 4.

You plan to develop a parallel application by using Windows HPC Server 2008. You need to ensure that when the application starts, a parameter value is communicated to each process in the cluster by using a single call. Which function should you use?

- A. MPI_Send
- B. MPI_Bcast
- C. MPI_Gather
- D. MPI_Reduce

Answer: B

Question: 5.

You plan to develop a single program multiple data (SPMD) application by using Windows HPC Server 2008. You use multiple processes to perform intermediate calculations and to provide the results as a single number. You need to ensure that the intermediate results are collected and added together by using a single MPI function. Which function should you use?

- A. MPI_Send
- B. MPI_Bcast
- C. MPI_Gather
- D. MPI_Reduce

Answer: D

Question: 6.

You develop a parallel application that will be deployed on a Windows HPC Server 2008 cluster. You write the following code segment. (Line numbers are included for reference only.) 01 int rank; 02 MPI_Comm_rank(MPI_COMM_WORLD, &rank); 03 // declaration of

```
variable hostName 04 // code to execute 05 06 std::cout << "hostname of rank " << rank;
07 std::cout << ": " << hostName << "\n";
```

You need to ensure that a variable named `hostName` contains the name of the cluster node that the code runs on. Which code segment should you add at line 05?

- A. `char *hostName = getenv("MPI_HOSTNAME");`
- B. `char hostName[MPI_MAX_PROCESSOR_NAME]; int resultlen; MPI_Get_processor_name(&resultlen, hostName);`
- C. `char hostName[MPI_MAX_NAME_STRING]; int resultlen; MPI_Comm_get_name(MPI_COMM_WORLD, hostName, &resultlen);`
- D. `char hostName[256]; int resultlen = sizeof(hostName); if (rank == 0) { gethostname(hostName, resultlen); }`

Answer: B

Question: 7.

You develop a parallel application that will be deployed on a Windows HPC Server 2008 cluster. You write the following code segment. (Line numbers are included for reference only.)
01 `MPI_Init(&argc, &argv);`
02 03 {
04 // program part for rank 0
05 06 }
07 else {
08 // program part for all other ranks
09 }
10 `MPI_Finalize();`
You need to ensure that the code in the rank 0 section only executes on the process that has a rank of 0. Which code segment should you insert at line 02?

- A. `int size; MPI_Comm_size(MPI_COMM_WORLD, &size); if (size > 0)`
- B. `int size; MPI_Comm_size(MPI_COMM_WORLD, &size); if (size == 0)`
- C. `int rank MPI_Comm_rank(MPI_COMM_WORLD, &rank); if (rank == 0)`
- D. `char hostName[MPI_MAX_PROCESSOR_NAME]; int resultlen; MPI_Get_processor_name(hostName, &resultlen); char masterName[] = "rank0"; if (strcmp(masterName, hostName) != 0)`

Answer: C

Question: 8.

You develop a parallel application that will be deployed on a Windows HPC Server 2008 cluster. The application uses Point-to-point communication. The process that has a rank 0 sends an array of integer values to the rank 1 process by using the following code

segment. (Line numbers are included for reference only.) 01 int values[5]; 02 MPI_Send(values, 5, MPI_INT, 1, 42, 03 MPI_COMM_WORLD); You need to ensure that each receiving process is able to correctly receive the values in the most efficient manner possible. Which code segment should you use?

- A. int values[5]; int buffer[5]; MPI_Reduce(buffer, values, 5, MPI_INT, MPI_SUM, 1, MPI_COMM_WORLD);
- B. int values[5]; MPI_Status status; MPI_Recv(values, 5, MPI_INT, 0, 42, MPI_COMM_WORLD, &status);
- C. int value; MPI_Status status; MPI_Recv(&value, 1, MPI_INT, 0, 42, MPI_COMM_WORLD, &status);
- D. int values[5]; MPI_Status status; MPI_Recv(values, sizeof(int), MPI_INT, 0, 42, MPI_COMM_WORLD, &status);

Answer: B

Get Full Version of Exam 70-691 PDF Q&A

techeXams presents authentic, genuine and valid study material, which promise 100% success in very first attempt. To take optimal results for 70-691 exam, you need to buy full version of 70-691 question and answer. An average of approximately 10 to 15 hours should be spent to study these exam questions and you will surely pass your exam. So come join us and quench your thirst for knowledge.
